# Intro.

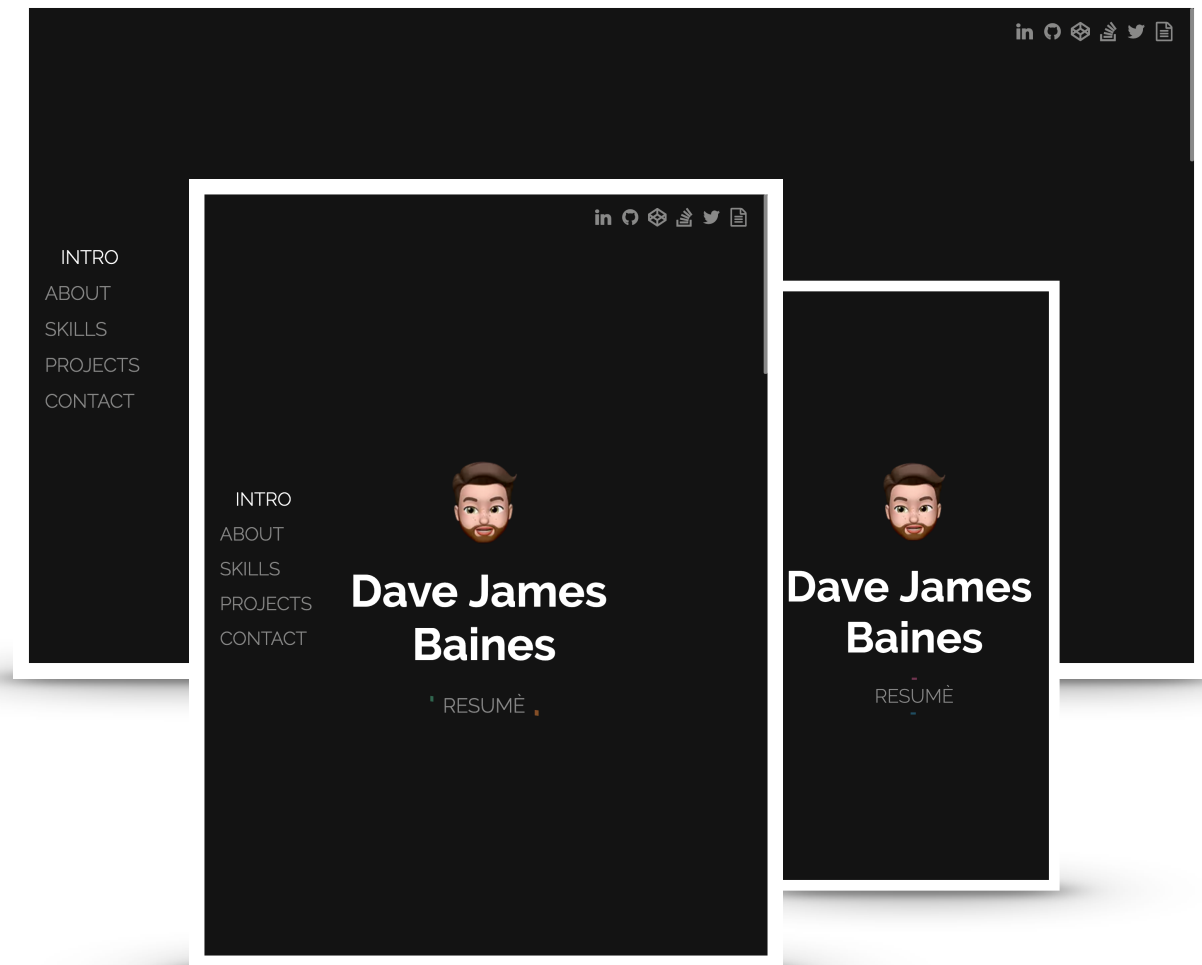

On every page, there is a fixed Nav Sidebar and Header that provides quick access to all pages on my portfolio as well as links to my social media.

The Nav Sidebar uses a small amount of Javascript to do a smooth scroll to the clicked page and also highlight the page the user is currently on.

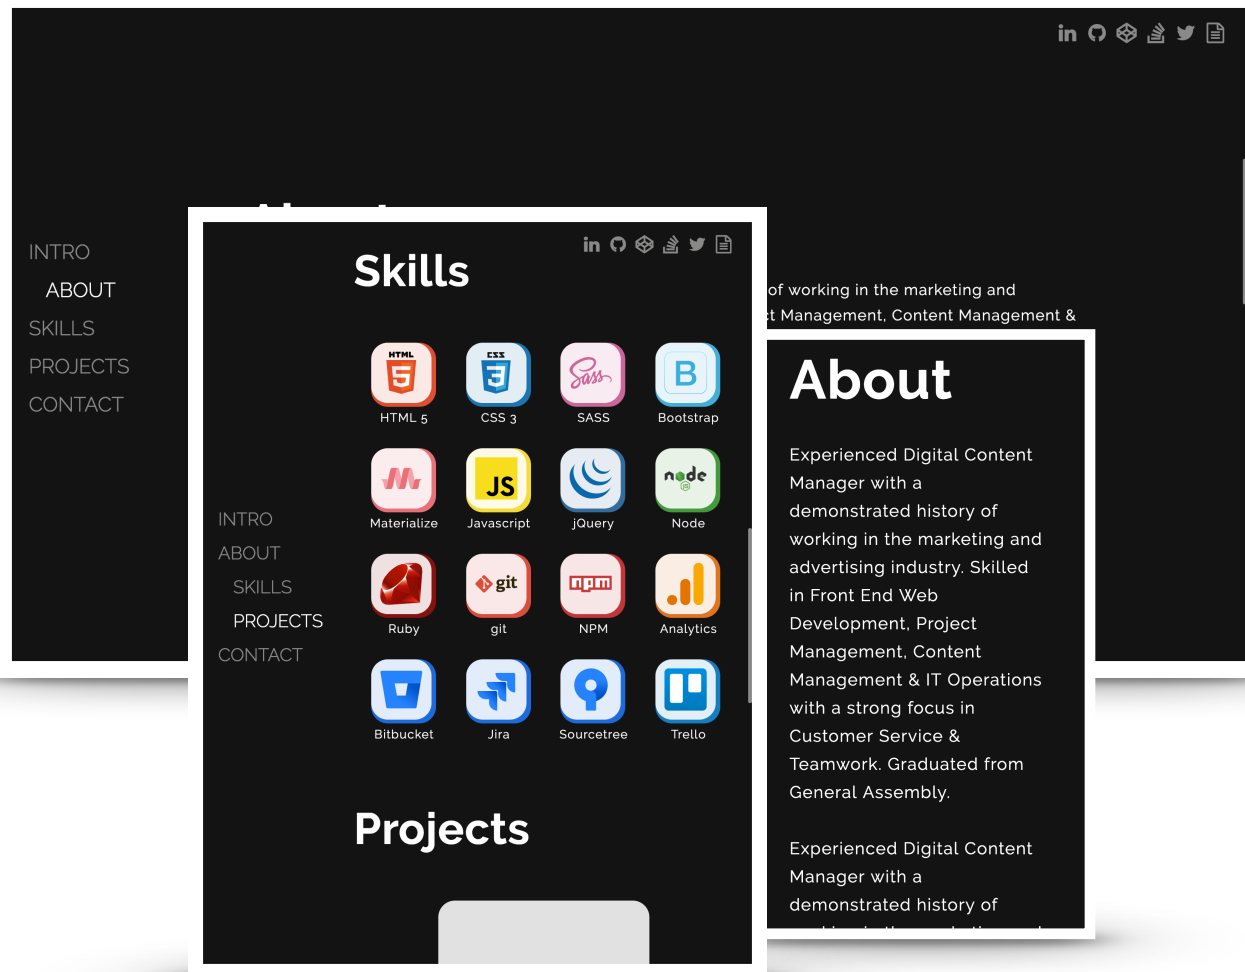

There are subtle hover effects on the sidebar and header to indicate the mouse is over them and that they are clickable.

The Intro page shows the user my name, an Animoji of my head and a link to an online version of my resumé.

The resumé button has animated colours the slowly rotate around the text. When hovering over the button, the colours become more intense and create a solid border with many colours. This button was created using CSS transforms.

# About & Skills.

The About page contains an about summary of myself in text. CSS is being used to change the highlight colour of the text to match the theme of my page.

The skills page uses "App" like icons to display the relevant skills I have in programming. All images are Vector as they are scalable and small in file size.

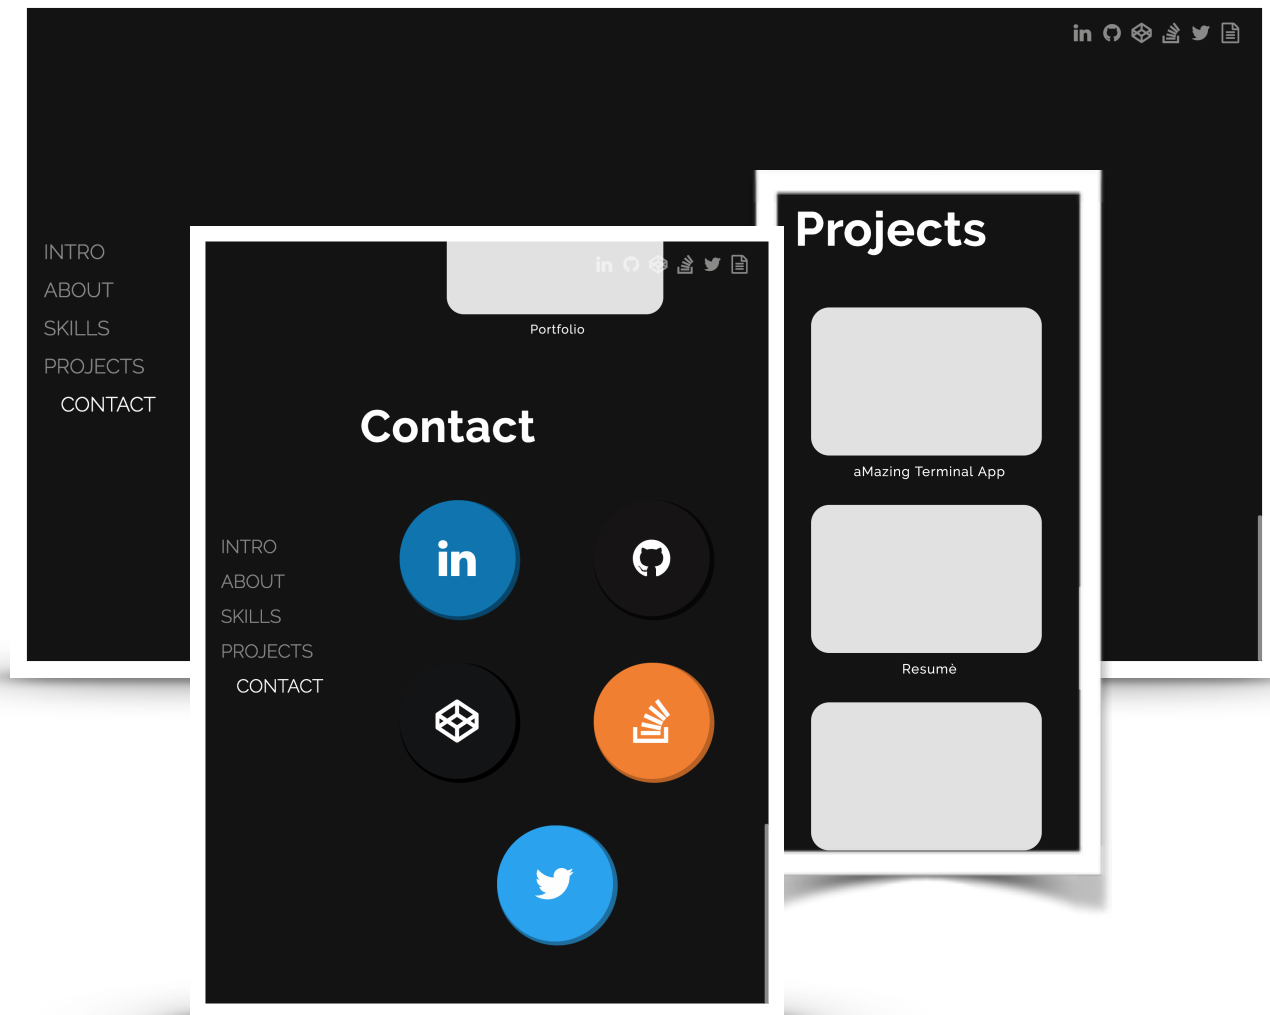

The icons are created using a transparent white box overlaying another box slightly bigger that has a background colour matching the darkest colour in the brand image.

# Projects & Contact

The projects page uses “card” like elements to show the completed projects I have created. Due to time constraints, the previews for these cards are empty, however, what should display here is a screenshot of each project.

The contact page shows the same items found in the header of the page which are links to my LinkedIn, GitHub, Cod pen, Stack Overflow and Twitter accounts.

The contact icons are created using CSS and SVG icons. The background colour is the brands colour with a small shadow 10% darker than the brand colour.
